

jelly

JE S

: product card

Jelly is a modular seating system designed for the flexible arrangement of public spaces, educational establishments, as well as relaxation zones in modern office spaces.

Thanks to its modular design, Jelly allows different elements to be freely combined to create comfortable and aesthetically pleasing layouts tailored to individual users' needs.

collection advantages

flexible modularity

The collection features four individual modules: a seat with a backrest, a corner backrest, a pouf, and a pouf with a tabletop. Each module, set on legs, can be easily combined with others, allowing for endless configuration possibilities.

three base options

Jelly seating is available in three base variations: on legs, with a swivel base, and a mobile version with wheels.

durability and lightness

The seating structure is made entirely from a material created using rotomoulding technology, ensuring the furniture's durability. Additionally, the use of rotomoulding reduces the weight of the furniture by approximately 40% compared to production using standard materials.
